T helper 2 (Th2) and B cells in atopic dermatitis

- learning from inborn errors of immunity

Rajka symposium (ISAD) 2025

Prof Cindy Ma

Experiments of Nature: Inborn errors of Immunity

Garvan Institute of Medical Research

- Are human knock-outs
- Caused by monogenic mutations in key genes
  - result in loss or gain of function
- Compromised immune system
  - severe/recurrent infections
  - allergy/atopic disease
  - autoimmunity
  - Inflammation
  - cancer

Why study Inborn Errors of Immunity?

Garvan Institute of Medical Research

- Often not clear how gene defect results in clinical disease
- Aim: reveal how gene defects result in clinical disease.
  - Provide an explanation for disease pathogenesis
  - Facilitate diagnosis/therapy
  - Determine function of specific genes
  - Lead to development of novel therapies
- Studying rare disorders can provide insights into more common diseases that affect the general population
  - ie allergies, fungal infections (thrush), and viral infections.

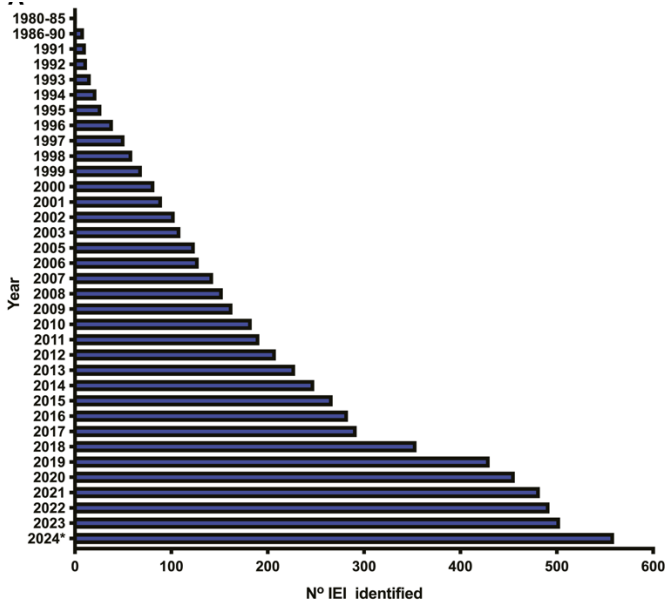
Human inborn errors of immunity: 2024 update on the classification from the International Union of Immunological Societies Expert Committee

M. Cecilia Poli[1,2], Ivona Aksentijevich[3], Ahmed Aziz Bousfiha[4,5], Charlotte Cunningham-Rundles[6], Sophie Hambleton[7], Christoph Klein[8], Tomohiro Morio[9], Capucine Picard[10,11], Anne Puel[12,13,14], Nima Rezaei[15], Mikko R.J. Seppänen[16], Raz Somech[17], Helen C. Su[18], Kathleen E. Sullivan[19], Troy R. Torgerson[20], Isabelle Meyts[21]*, and Stuart G. Tangye[22,23]*



- 508 genes causing 559 inborn errors of immunity
- Primary Atopic Disorders refer to ~50 genes associated with atopic manifestations –
  - Early onset, treatment resistant eczema, eosinophilia, food anaphylaxis
- Recent reviews
  - Ma and Hsu *Immunol Rev* 2025
  - Vaseghi-Shanjani et al. *Curr Opin Immunol* 2025
  - James et al. *J Allergy Clin Immunol* 2024

Primary Atopic Disorders

Garvan Institute of Medical Research

- **Skin barrier**
  - **Structural proteins – filaggrin (*FLG*)**
  - **Intracellular adhesion molecules - corneodesmosin (*CDSN*), desmoplakin (*DSP*), desmoglein 1 (*DSG1*)**
  - **Protease inhibitors - *SPINK5***
- **Granulocyte dysregulation (increased mast cell degranulation)**
  - **phospholipase C gamma 2 (*PLCG2*), adhesion G protein-coupled receptor E2 (*ADGRE2*), *TPSAB1***
- **Actinopathies**
  - ***DOCK8*, *WASP*, *WIP*, *ARPC1B*, *NCKAP1L*, *STK4***

Primary Atopic Disorders

Garvan Institute of Medical Research

- **T-cell receptor signaling**
  - ***CARD11* (CARMA1), *BCL10*, *MALT1* – CBM-opathies**
  - **Hypomorphic *ZAP70*, *LAT***
- **Altered T cell receptor development**
  - ***RAG1/2*, *IL7RA*, Artemis, DNA ligase IV, adenosine deaminase**
- **Tregopathies**
  - ***FOXP3*, *CD25* (IL-2RA)/*STAT5B*, *CTLA4*/LRBA, *BACH2***
- **Metabolic defect**
  - ***PGM3***

Primary Atopic Disorders

Garvan Institute of Medical Research

- **Cytokine signaling**
  - ***IL12R*/*IFNGR*/TBX21**
  - ***TGFBR*, *ERBIN***
  - **JAKs/STATs (Gain-of-function *JAK1, STAT6;* Loss-of-function *STAT3*)**

- ***Overlap…***

Hyper IgE syndrome (HIES)

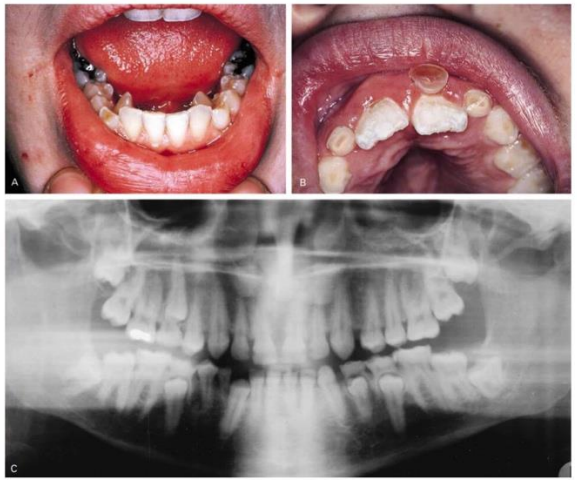
Garvan Institute of Medical Research

- Rare primary immunodeficiency: ~ 1 in 100,000
- Characterised by clinical triad:
  - Recurrent Staphylococcal and Candida skin abscesses (opportunistic infections)
  - Recurrent cyst-forming pneumonia (*S. aureus, S. pneumoniae, H. influenzae*)
  - Elevated serum IgE (> 10x): other Igs are normal but often lack Ag-specific Abs
  - Atopic disease – eczema and/or food allergies
- Autosomal dominant (AD) and autosomal recessive (AR) forms

Autosomal dominant hyper IgE syndrome (AD-HIES)

Garvan Institute of Medical Research

- **AD-HIES is associated with skeletal symptoms**
  - typical HIES face, high palate, retained primary teeth, hyperextensibility of joints, scoliosis, osteoporosis, recurrent fractures
  - Defects not restricted to the immune system: connective tissue phenotypes



Grimbacher *et al*. 1999. *NEJM*

2007: AD-HIES is due to mutations in *STAT3*

AD-HIES due to mutations in *STAT3*

Garvan Institute of Medical Research

How do defects in STAT3 explain the phenotype of AD-HIES patients?

1. **Opportunistic infections**
2. **Humoral (antibody) defects**
3. **Atopic disease**

AD-HIES due to mutations in *STAT3*

Garvan Institute of Medical Research

How do defects in STAT3 explain the phenotype of AD-HIES patients?

1. **Opportunistic infections**
2. **Humoral (antibody) defects**
3. **Atopic disease**

AD-HIES due to mutations in *STAT3*

Garvan Institute of Medical Research

How do defects in STAT3 explain the phenotype of AD-HIES patients?

1. **Opportunistic infections**
   - **$CD4^+$ T cell defect in generating Th17 cells (require STAT3-cytokines IL-6, IL-21, IL-23)**

   (Milner et al *Nature* 2008; Ma et al *JEM* 2008; de Beaucoudrey et al *JEM* 2008; Renner et al *JACI* 2008)
2. **Humoral (antibody) defects**
3. **Atopic disease**

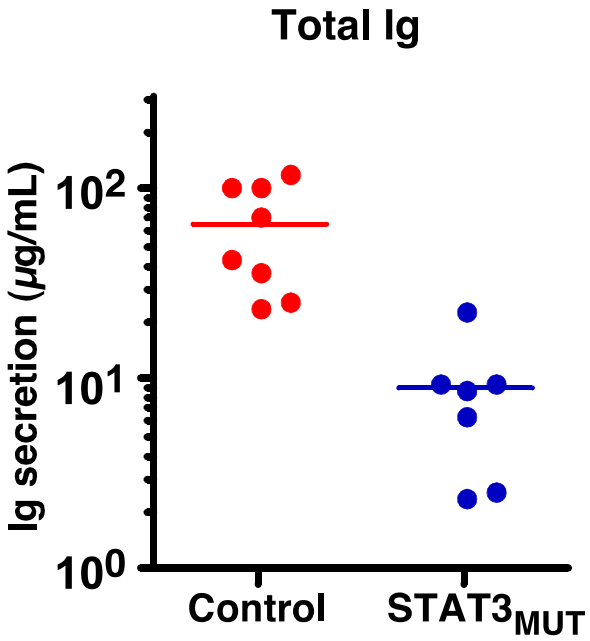
Garvan Institute of Medical Research

1. Opportunistic infections:
2. **Humoral defects:**
   - **STAT3 loss-of-function (LOF) patients have normal Ig levels but often lack Ag-specific Abs**
3. Atopic disease

STAT3 LOF B cells can secrete polyclonal, but not Ag-specific Ig *in vitro*

Garvan Institute of Medical Research

- polyclonally stimulate B cells *in vitro* for 7 days
- determine Ig secretion and Ag (tetanus) specific B cells



Avery *et al. 2010* JEM

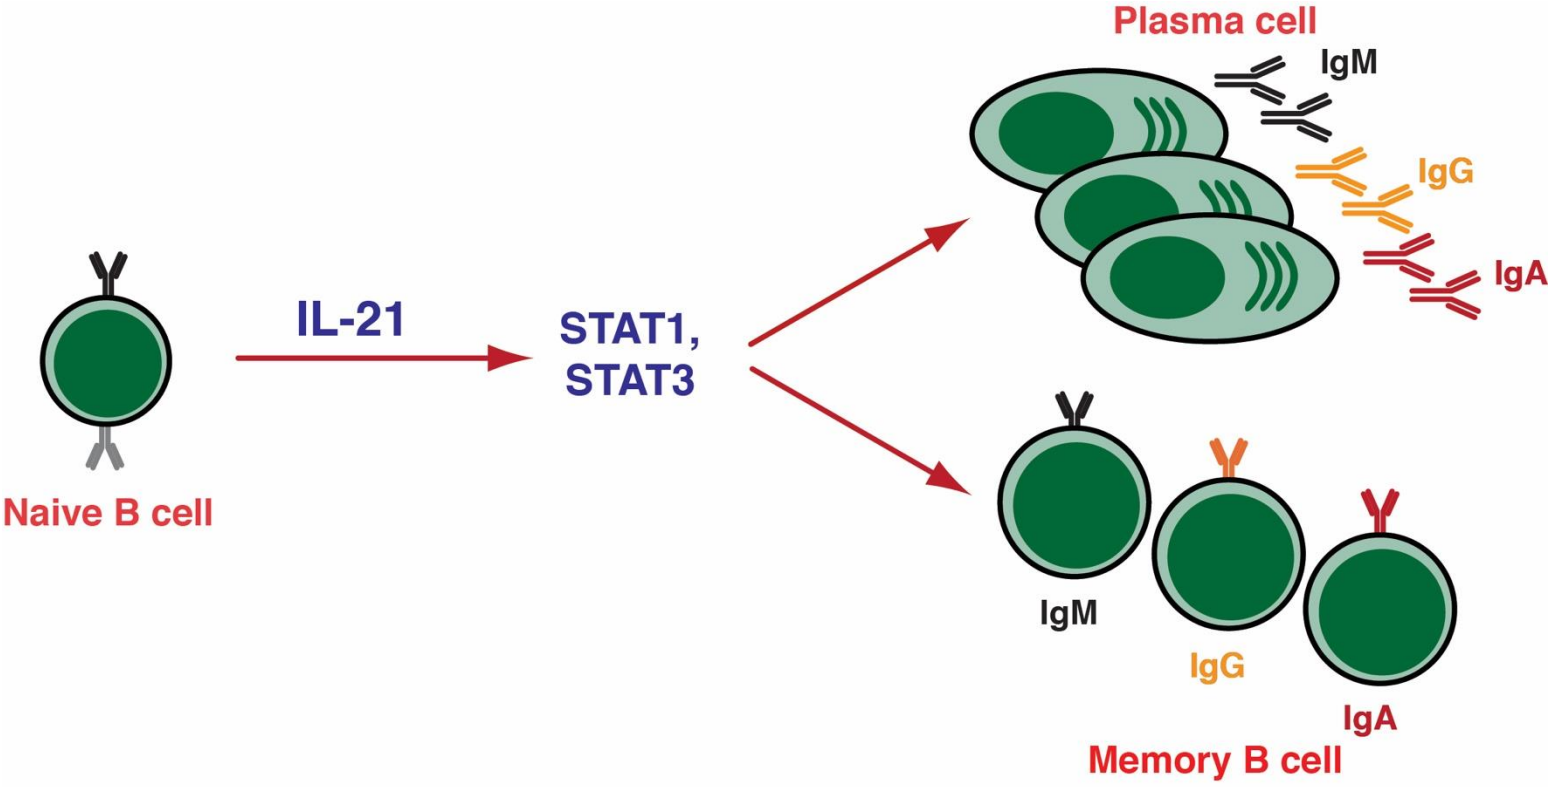
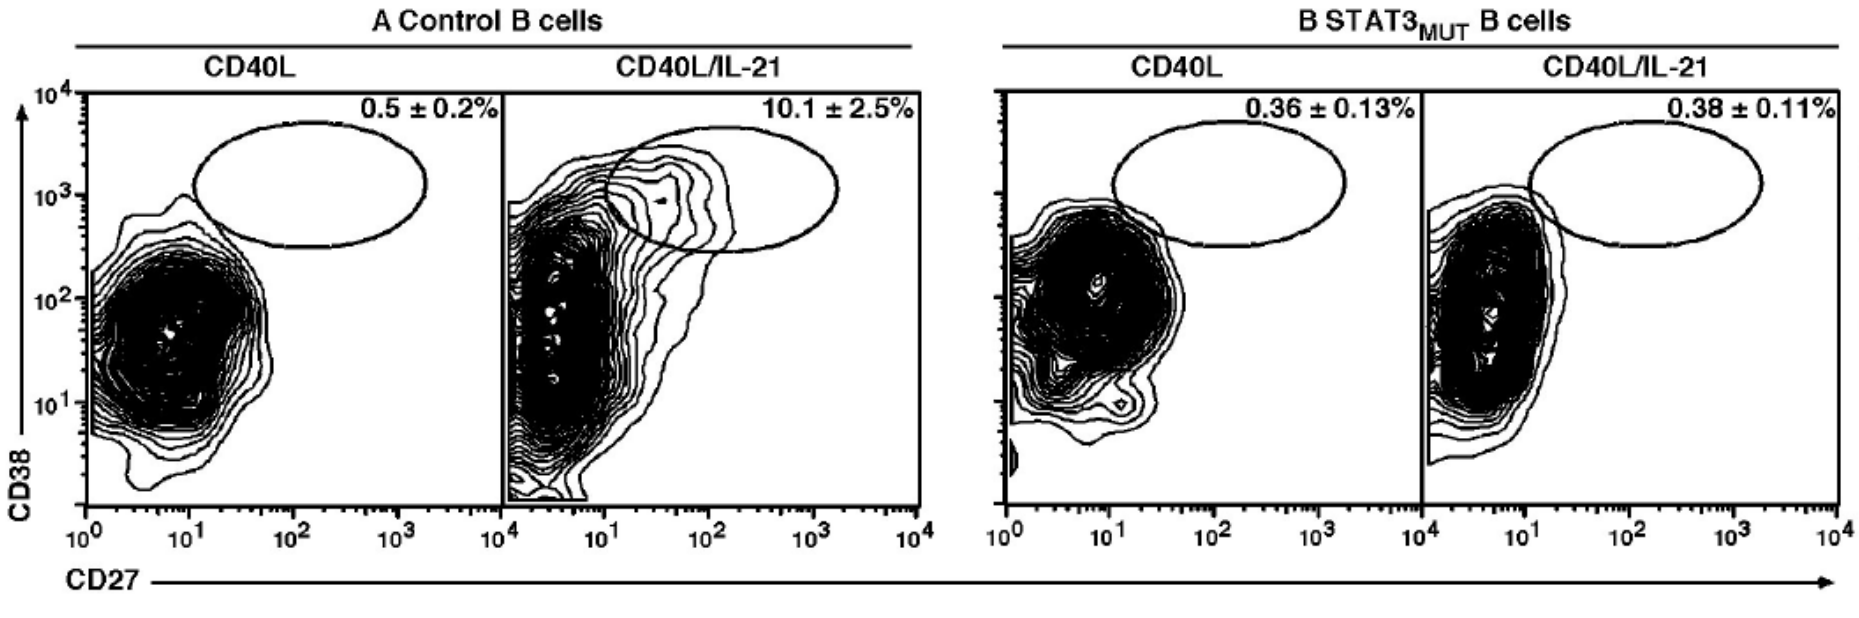
Q: Is IL-21 induced human B cell differentiation dependent on STAT3?

Garvan Institute of Medical Research



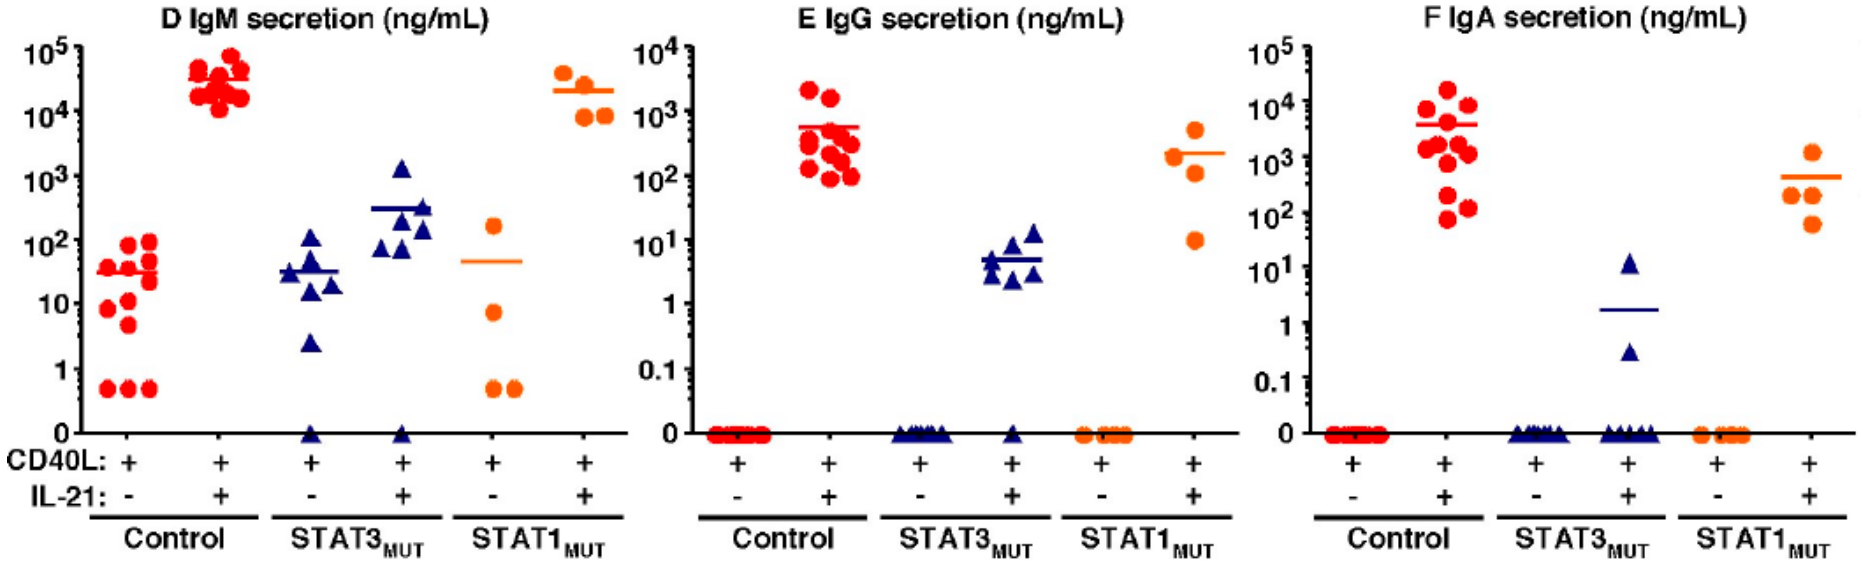
STAT3 is required for IL-21-mediated differentiation of naive B cells into CD38^{+}CD27^{+} plasmablasts

Garvan Institute of Medical Research



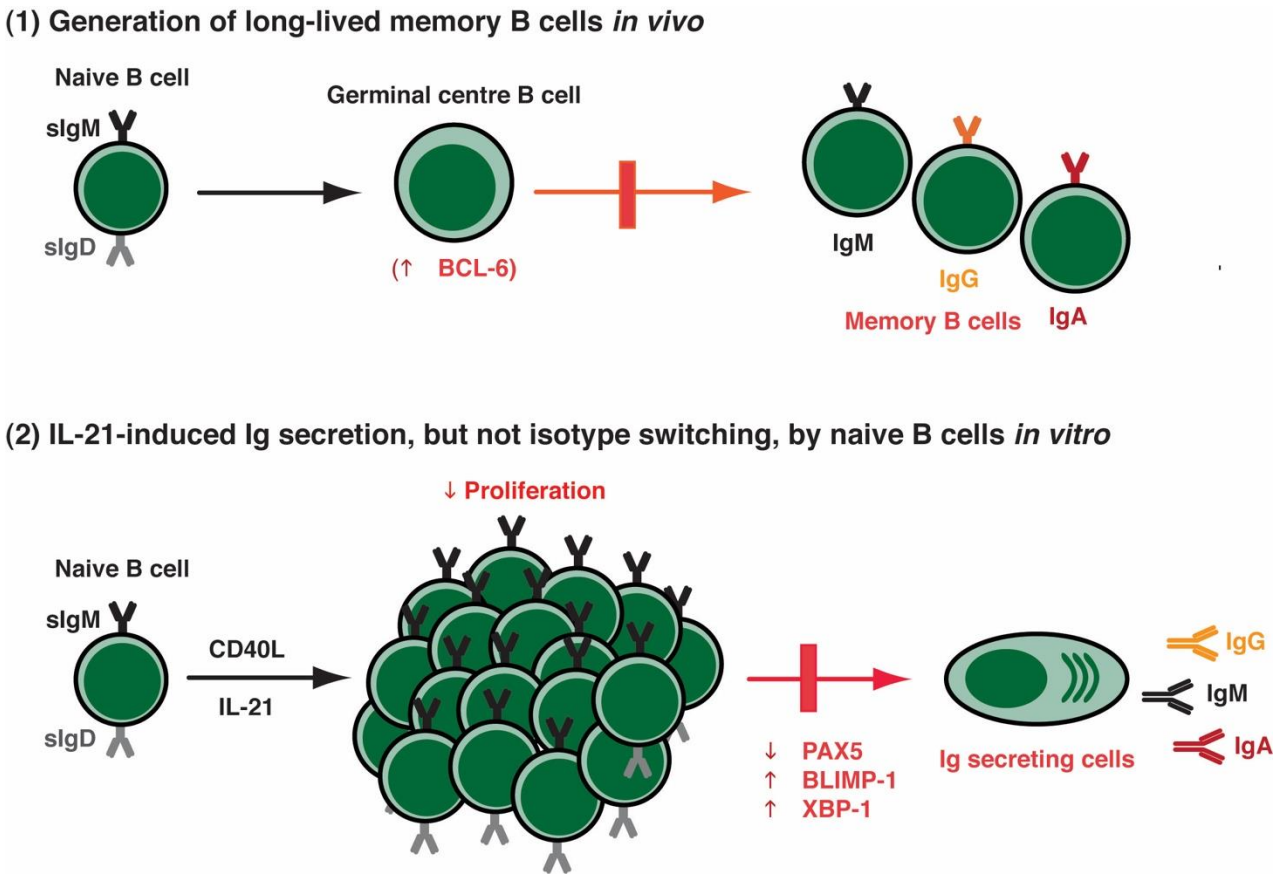
STAT3, but NOT STAT1, is required for IL-21-mediated differentiation of naive B cells into Ig-secreting cells

Garvan Institute of Medical Research



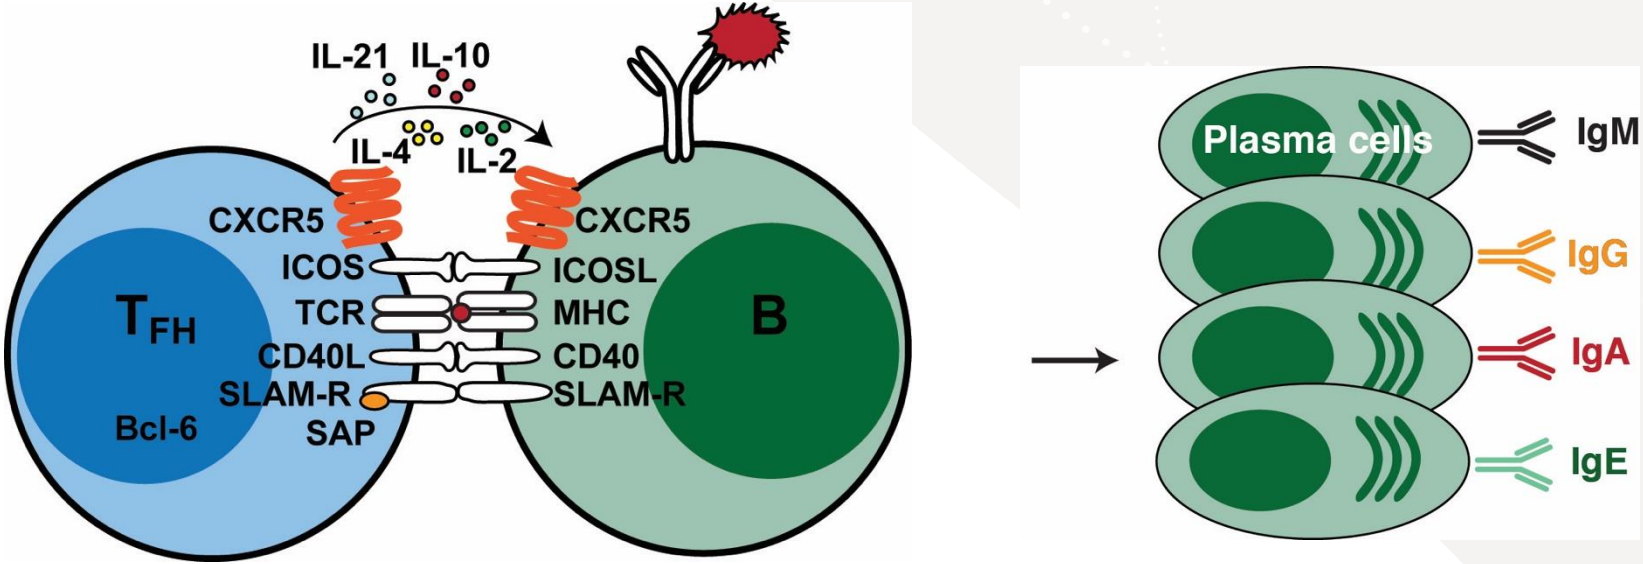
Roles of STAT3 in regulating B-cell responses

Garvan Institute of Medical Research

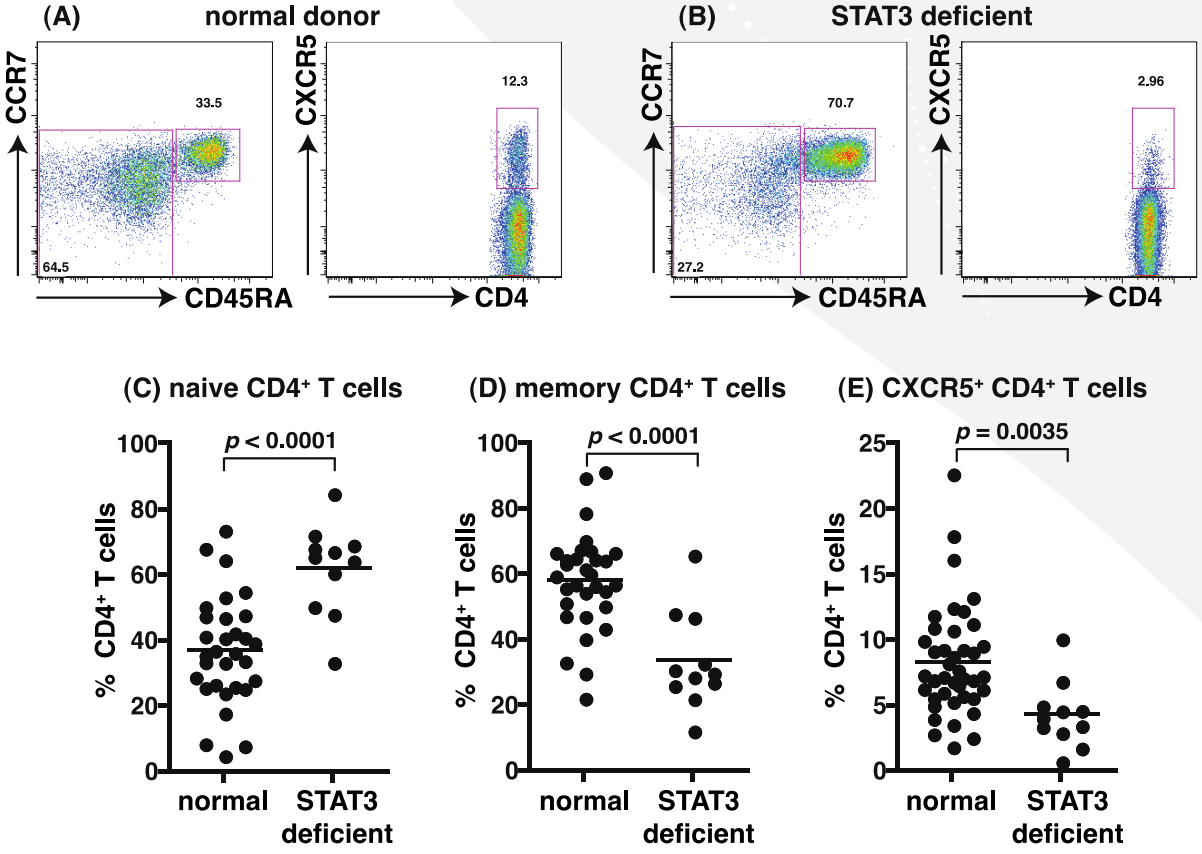


What about T follicular helper (Tfh) cells?

Garvan Institute of Medical Research

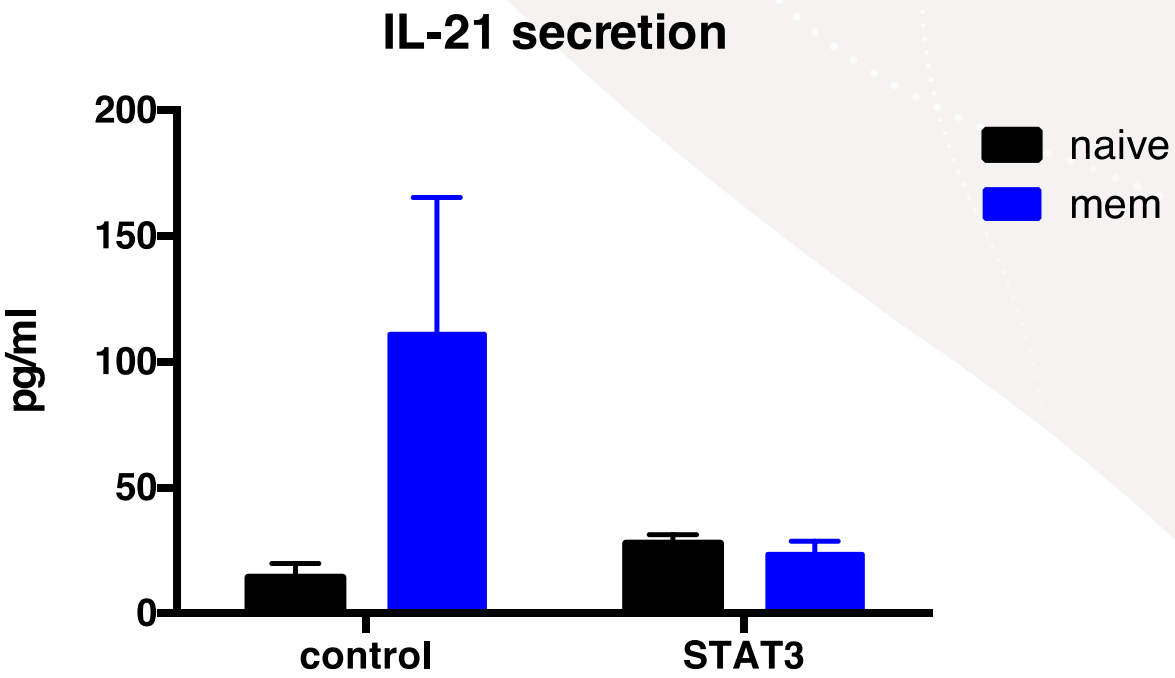


Decrease in CXCR5⁺CD4⁺ Tfh cells in STAT3 LOF patients



Defective secretion of IL-21 by STAT3 LOF memory CD4^{+} T cells *ex vivo*

Garvan Institute of Medical Research



AD-HIES due to mutations in *STAT3*

Garvan Institute of Medical Research

How do defects in STAT3 explain the phenotype of AD-HIES patients?

1. Opportunistic infections
2. Humoral (antibody) defects
   - B cell intrinsic: defect in generating memory/effector B cells
     - Requirement for IL-21 (Avery et al *JExpMed* 2010)
   - B cell extrinsic: defect in generating T follicular helper cells
     - Requirement for IL-6, IL-12, IL-21, IL-23, IL-27 (Ma et al *Blood* 2012; Batten et al *JExpMed* 2010)
3. Atopic disease

AD-HIES due to mutations in *STAT3*

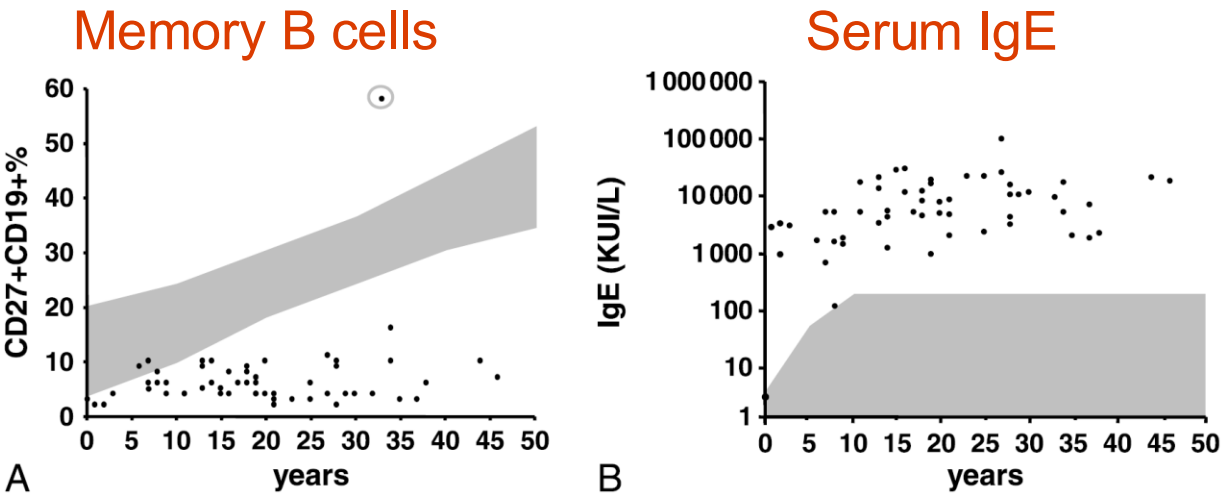
Garvan Institute of Medical Research

How do defects in STAT3 explain the phenotype of AD-HIES patients?

1. Opportunistic infections
2. Humoral (antibody) defects
3. **Atopic disease**

Why do STAT3 LOF patients get Hyper IgE?

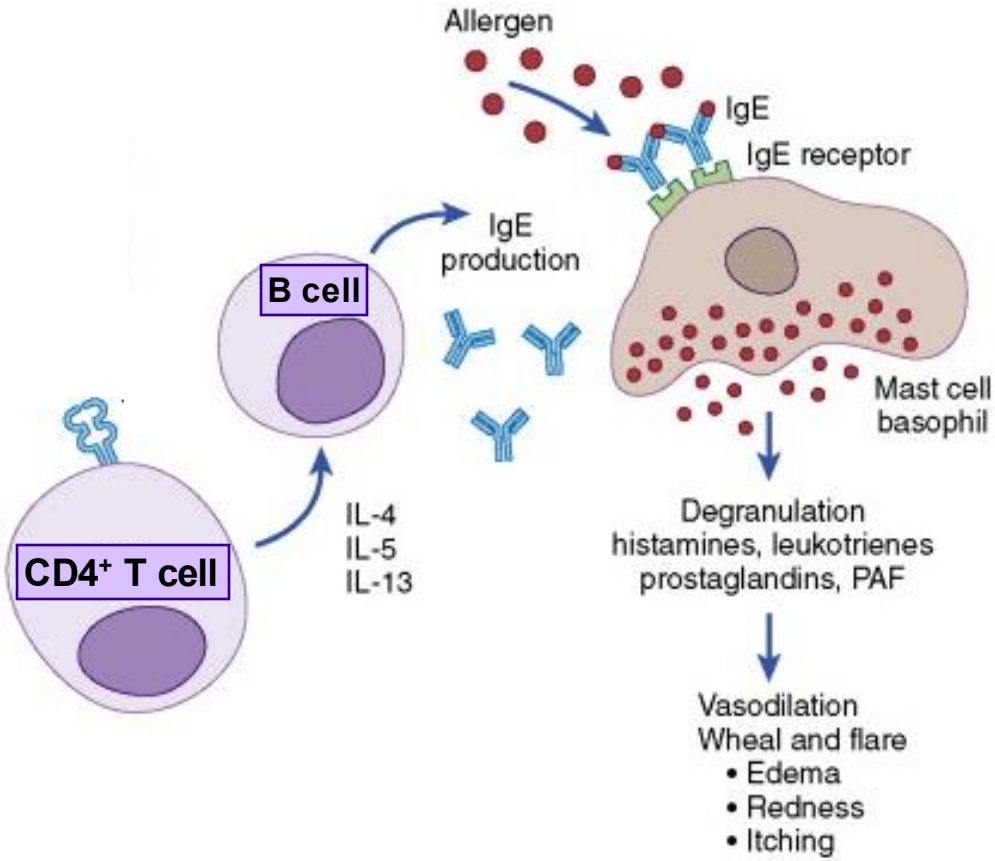
- **STAT3 LOF patients have clear humoral defects**
- **STAT3 LOF patients have increased serum IgE and associated atopic disease**



Chandesris et al. *2012 Medicine*

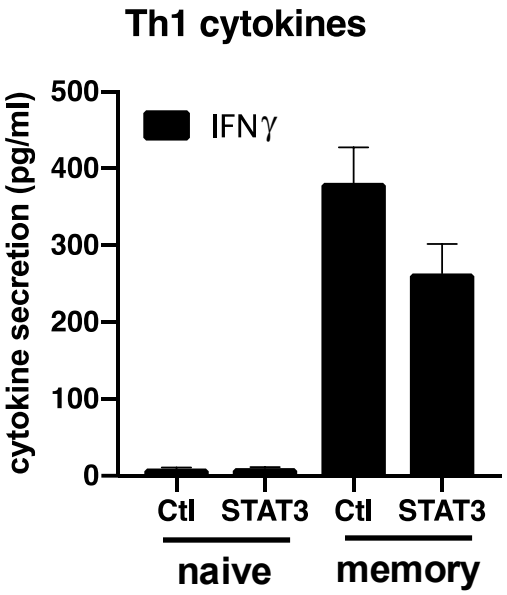
CD4⁺ T cells (IL-4/5/13) cause allergy

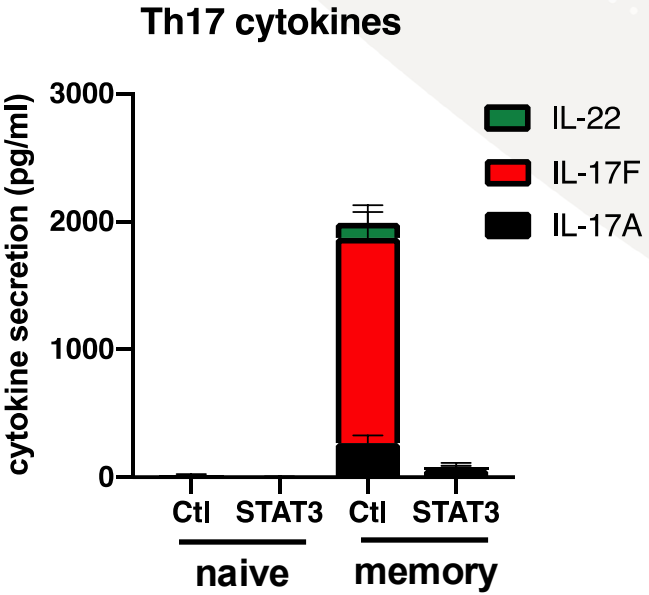
Garvan Institute of Medical Research

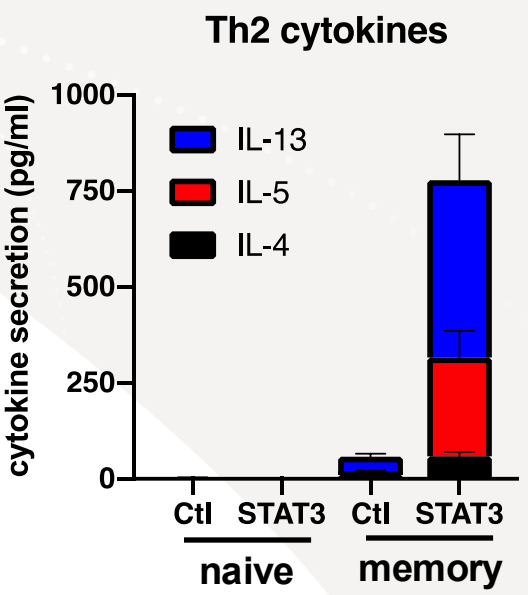


STAT3 LOF CD4+ T cells have increased Th2 cytokine production

Garvan Institute of Medical Research



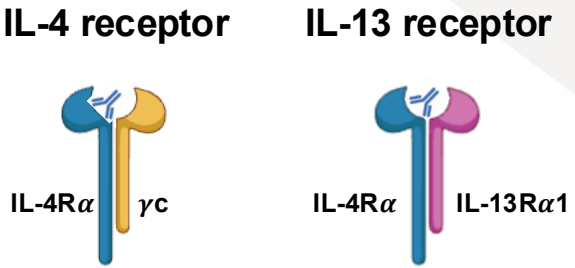




Dupilumab: mAb against IL-4R (IL-4/IL-13)

Garvan Institute of Medical Research

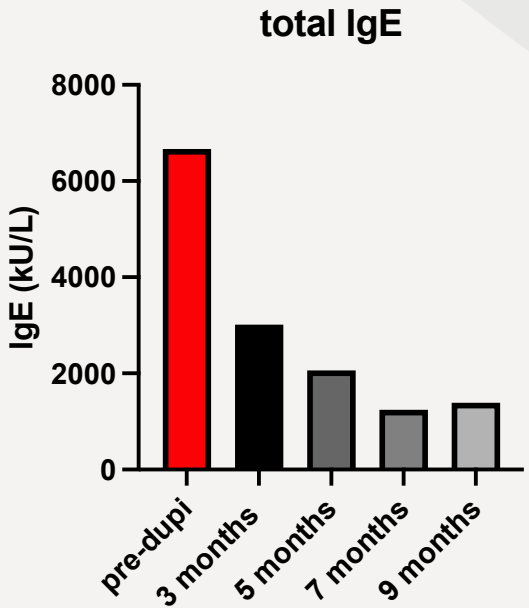
mAb binds to the IL-4Rα subunit of the IL-4 and IL-13 receptors



Dupilumab: STAT3 LOF patient resulted in decrease serum IgE

Garvan Institute of Medical Research

- **STAT3 LOF patient treated with Dupilumab because of increase Th2 cytokines**



Peter McNaughton

Summary 1

- CD4$^+$ T cells from STAT3 LOF patients are skewed towards IL-4/5/13 producing cells
- Th2 cytokine producing cells likely contribute to allergies in these patients
  - STAT3 restrains Th2 cells

- How does STAT3 restrain Th2 cytokine production?

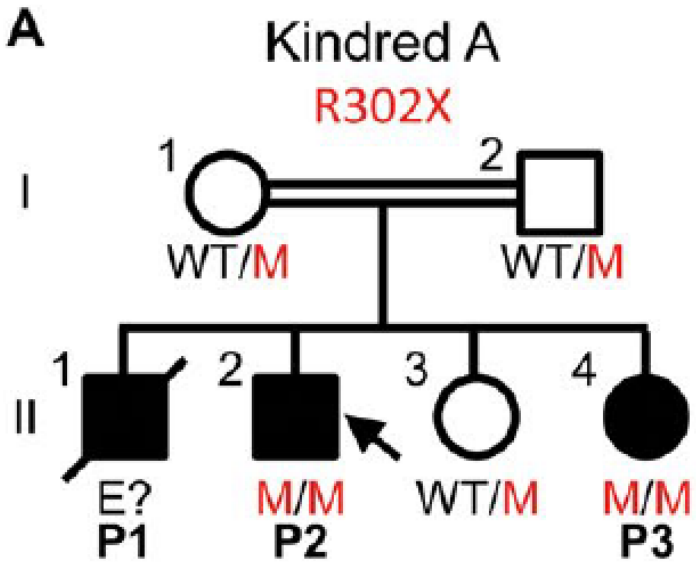
2018: Unique case of HIES
(Jean-Laurent Casanova, Anne Puel, Vivien Beziat)

Garvan Institute of Medical Research

- hyper IgE
- atopic dermatitis, eosinophilia, allergy
- recurrent *Staph* infections
- lung disease (bronchiecstasis, pneumatoceles, pneumonia, infections)
- chronic mucocutaneous candidiasis
- connective tissue defects (mild)

Beziat et al. 2018 *Sci Immunol*

NOT STAT3-deficient patient as “autosomal recessive” form of HIES!



- **Performed whole genome sequencing**

Beziat et al. 2018 *Sci Immunol*

Summary 2

- ZNF341 regulates expression of STAT3
- ZNF341 and STAT3-deficient CD4$^+$ T cells are skewed towards Th2 cytokine producing cells.
  - likely to contribute to allergies/atopic disease in these patients

Short Communication

Somatic mosaicism in B cells of a patient with autosomal dominant hyper IgE syndrome

Julio C. Alcántara-Montiel[1,4], Tamara Staines-Boone[2], Gabriela López-Herrera[3], Laura Berrón-Ruiz[3], Carlos R. Borrego-Montoya[2] and Leopoldo Santos-Argumedo[1]

Apart from that, the HIES mosaic patient showed plaques of erythema with scales and pustules in the nostrils, anterior thorax, gluteal, and inguinal folds. The HIES mosaic patient had cold abscesses in several body parts such as the scalp, frontal region, and limbs. He was treated with antibiotics and antifungals, and on some occasions, surgical drainage was performed. The patient also had high concentrations of IgE range (552–4988 IU/mL), normal eosinophil count range (58–700 cell/μL) see Supporting Information Tables 4 and 5, but low compared to the classical HIES patient; in addition, *Staphylococcus aureus* was isolated several times. Nonimmunological features such as scoliosis, high palate, and hyperextensibility were also present.

Upon physical examination the HIES mosaic patient did not

Identification of a T follicular helper cell subset that drives anaphylactic IgE

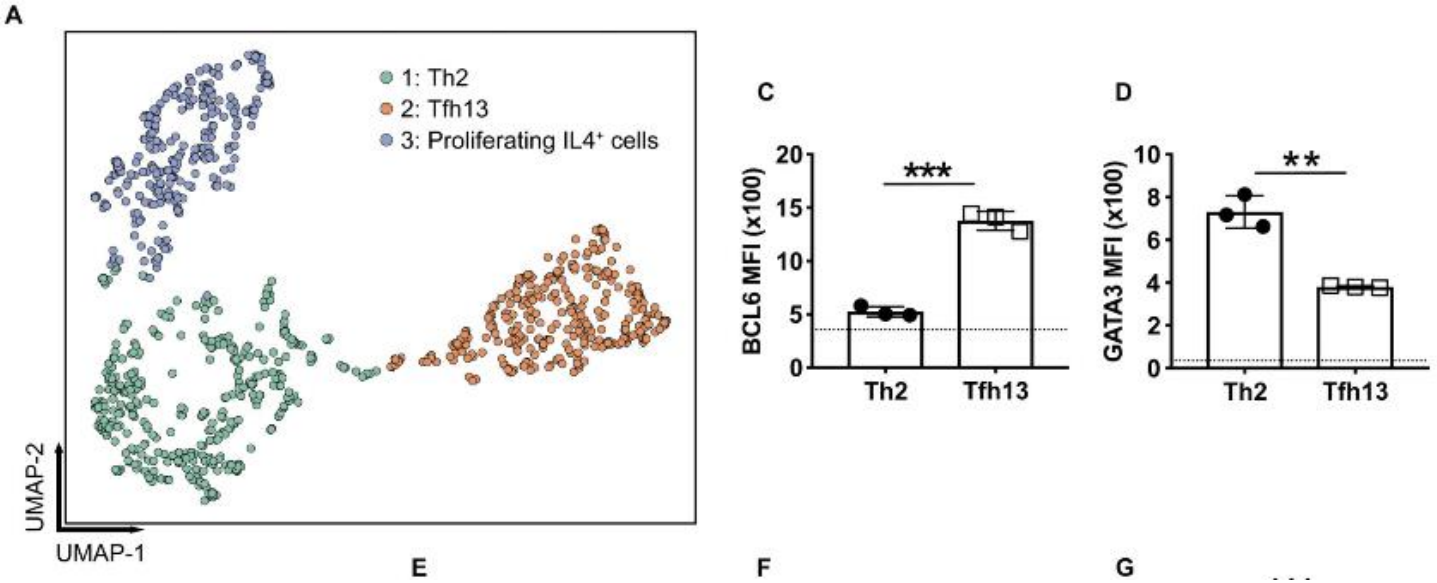
Uthaman Gowthaman[1,2], Jennifer S. Chen[1,2*], Biyan Zhang[1,2*], William F. Flynn[3], Yisi Lu[2], Wenzhi Song[2], Julie Joseph[1], Jake A. Gertie[1,2], Lan Xu[1,2], Magalie A. Collet[3], Jessica D. S. Grassmann[3], Tregony Simoneau[4], David Chiang[5], M. Cecilia Berin[5], Joseph E. Craft[2], Jason S. Weinstein[6], Adam Williams[3,7*†], Stephanie C. Eisenbarth[1,2*†]

- Produce IL-4, IL-5 IL-13, IL-21
- Express GATA3 and BCL6
- Level of IL-21 lower than other Tfh cells

Tfh13 distinct from Th2

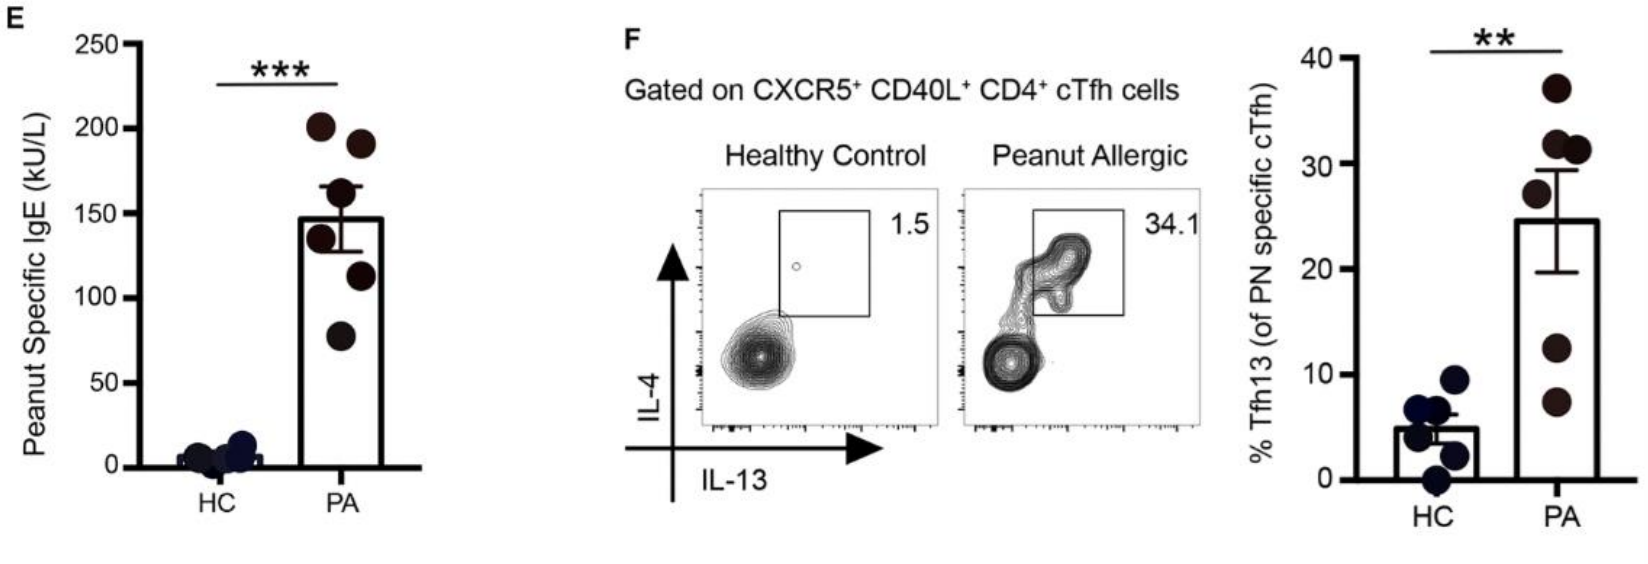
Garvan Institute of Medical Research

Mouse



Gowthaman et al. 2019 *Science*

Human with peanut allergy have Tfh13 cells



Gowthaman et al. 2019 *Science*

Current projects

Garvan Institute of Medical Research

- Looking in different IEI to see what restraisn and promotes Tfh13 cells
- Compare Tfh13 population between food allergy vs atopic dermatitis vs allergic rhinitis etc
- Assess Tfh13 population after Dupilumab treatment
  - useful in treating food anaphylaxis

Tfh13 cells are elevated in DOCK8 def but not STAT3 LOF
